

gnomAD v2.0.2 database extract for *DHDDS* (NM_024887.3)

Locally downloaded summary of population-level allele counts for the *DHDDS* c.124A>G (p.Lys42Glu) variant across gnomAD v2.0.2 sub-populations. This extract was used to inform the ACMG/AMP classification in the main manuscript (Biswas et al. 2017, Table 2 and Methods 2.4). It is NOT a cohort tally.

Sub-population	Total alleles (2n)	Allele count (AC)	Allele frequency (AF)	Homozygotes
African / African-American (AFR)	16,260	0	0.000	0
Latino (AMR)	33,560	1	2.98×10 ^{−5}	0
Ashkenazi Jewish (ASJ)	10,152	16	1.58×10 ^{−3}	0
East Asian (EAS)	8,648	0	0.000	0
European (Finnish) (FIN)	22,304	0	0.000	0
European (non-Finnish) (NFE)	111,558	5	4.48×10 ^{−5}	0
South Asian (SAS)	30,612	0	0.000	0
Other (OTH)	5,494	0	0.000	0
TOTAL (all populations)	238,588	22	9.22×10^{−5}	0

Caution. The 22 alleles reported here are **population-level alleles in the gnomAD reference database**. They are unrelated to, and should not be confused with, the proband-borne pathogenic allele tally reported in any clinical case series (including the Biswas et al. 2017 cohort).
